

# Bounded-Cost Search Using Estimates of Uncertainty

---

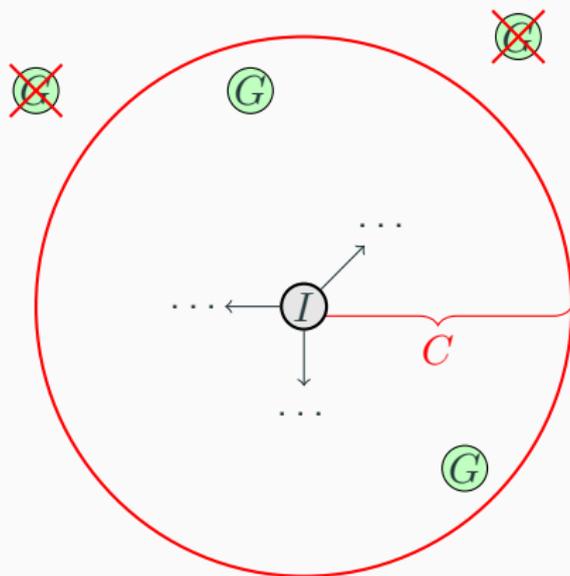

Maximilian Fickert, Tianyi Gu, Wheeler Ruml

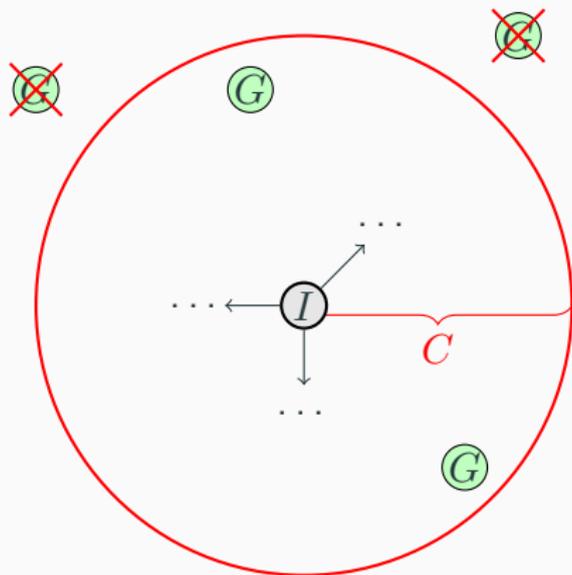

# Bounded-Cost Search

# Bounded-Cost Search

# Bounded-Cost Search

Objective: Find a plan with cost at most  $C$  as fast as possible.

# Previous Approaches

- Standard Heuristic Search with Pruning on  $C$
- Potential Search (PTS)<sup>1</sup>
  - best-first search on  $\frac{h}{C-g}$
- Bounded-cost Explicit Estimation Search (BEES)<sup>2</sup>
  - focal search:
    - *open* sorted by  $f$ , only nodes with  $g + h \leq C$
    - *focal* sorted by  $d$ , only nodes with  $g + \hat{h} \leq C$   
( $\hat{h}$  is corrected for the observed heuristic error<sup>3</sup>)

---

<sup>1</sup>Stern, Puzis, and Felner 2011.

<sup>2</sup>Thayer et al. 2012.

<sup>3</sup>Thayer, Dionne, and Ruml 2011.

# Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

## Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

$$\begin{array}{l} \textcircled{n_1} \quad T = 10 \\ \quad \quad p = 0.5 \end{array}$$

$$\begin{array}{l} \textcircled{n_2} \quad T = 6 \\ \quad \quad p = 0.25 \end{array}$$

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

# Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

$$\begin{array}{l} \textcircled{n_1} \quad T = 10 \\ \quad \quad p = 0.5 \quad \rightsquigarrow 20 \end{array}$$

$$\begin{array}{l} \textcircled{n_2} \quad T = 6 \\ \quad \quad p = 0.25 \quad \rightsquigarrow 24 \end{array}$$

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

# Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

$$\begin{array}{l} \textcircled{n_1} \quad T = 10 \\ \quad \quad p = 0.5 \end{array} \rightsquigarrow 20$$

How to obtain  $T$ ?

$$\begin{array}{l} \textcircled{n_2} \quad T = 6 \\ \quad \quad p = 0.25 \end{array} \rightsquigarrow 24$$

How to obtain  $p$ ?

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

# Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

$$\begin{array}{l} n_1 \\ T = 10 \\ p = 0.5 \end{array} \rightsquigarrow 20$$

How to obtain  $T$ ?  
→ just use  $d$

$$\begin{array}{l} n_2 \\ T = 6 \\ p = 0.25 \end{array} \rightsquigarrow 24$$

How to obtain  $p$ ?

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

# Expected Effort Search (XES)

Best-first search on the expected effort:<sup>4</sup>  $\frac{T}{p}$

- $T(n)$ : search effort to find a solution under  $n$
- $p(n)$ : probability that  $n$  leads to a solution within  $C$

$$\begin{array}{l} n_1 \\ T = 10 \\ p = 0.5 \end{array} \rightsquigarrow 20$$

How to obtain  $T$ ?

→ just use  $d$

$$\begin{array}{l} n_2 \\ T = 6 \\ p = 0.25 \end{array} \rightsquigarrow 24$$

How to obtain  $p$ ?

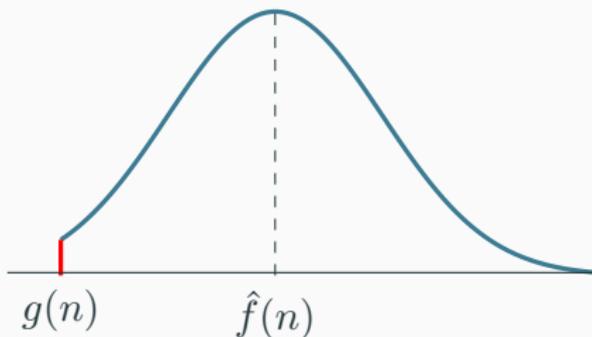

→ approximate from  $\hat{h}$  distribution

---

<sup>4</sup>First suggested by Dobson and Haslum (HSDIP'17).

# Obtaining $p$ from Belief Distributions

Nancy<sup>5</sup> belief distributions based on heuristic error observations<sup>6</sup>:

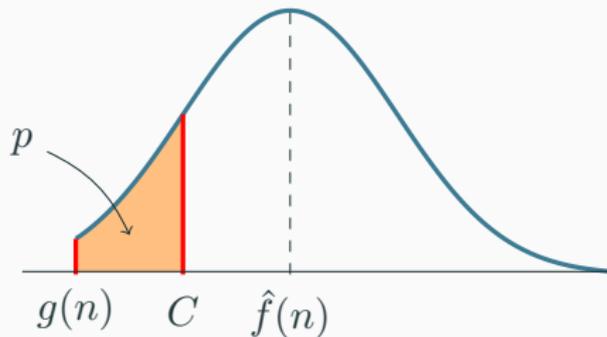

---

<sup>5</sup>Mitchell et al. 2019.

<sup>6</sup>Thayer, Dionne, and Ruml 2011.

# Obtaining $p$ from Belief Distributions

Nancy<sup>5</sup> belief distributions based on heuristic error observations<sup>6</sup>:

---

<sup>5</sup>Mitchell et al. 2019.

<sup>6</sup>Thayer, Dionne, and Ruml 2011.

XES optimizes search effort, assuming

1. the search explores one subtree at a time,
2. subtrees are independent, and
3. subtrees are abandoned after spending  $T(n)$  time.

# Using $p$ in BEES

BEES95:

- *open* sorted by  $f$ , only nodes with  $g + h \leq C$
- *focal* sorted by  $d$ , only nodes with  $g + \hat{h} \leq C$   $p(n) > 95\%$

## Planning Domains:

- Implementation in Fast Downward<sup>7</sup>
- Benchmarks:
  - IPC'18 cost-bounded track
  - Previous IPC domains with bounds from Planning.Domains<sup>8</sup>

## Search Domains:

- Sliding-Tile Puzzle, Vacuum World, Pancake, Racetrack

→ Cost-bounded algorithms dominate GBFS; XES is best overall.

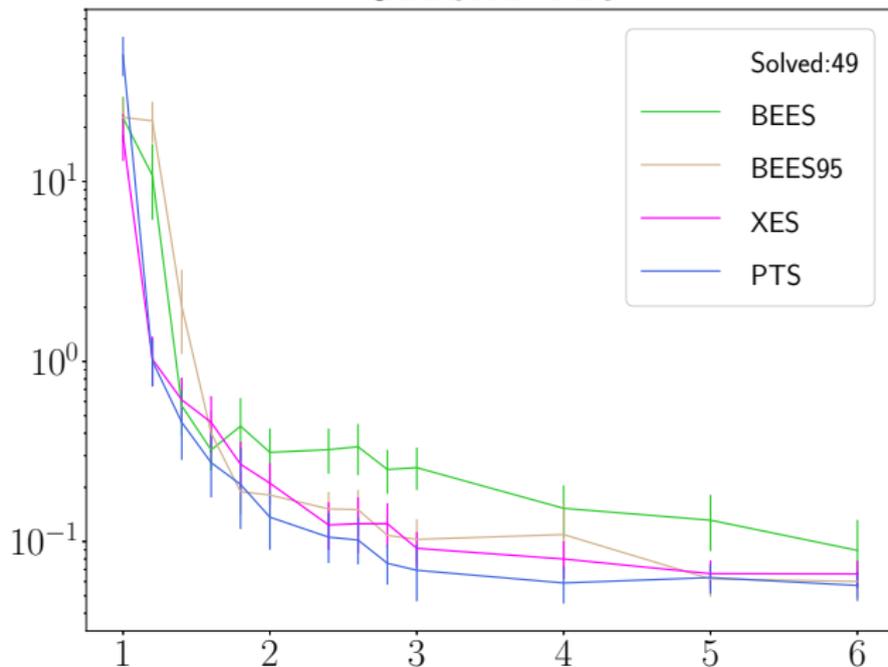

## Pre-2018 IPC Domains

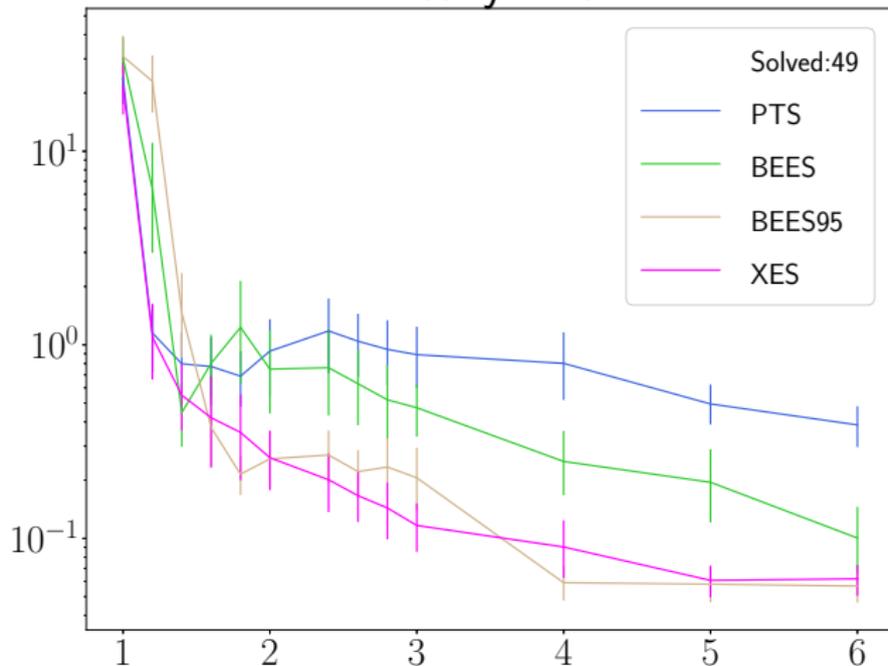

# Search Domains: Heavy Vacuum World

## Uniform Tile

## Heavy Tile

Expected Effort Search (XES):

- Optimizes search effort in a simplified model.
- Superior robustness and performance to comparable algorithms.

→ Advances the trend of leveraging distributional information in deterministic heuristic search.
